SELF-CLEANING  
GLIDING 2K PAINT

ANTIFOULING  
EFFECT

DOESN'T CONTAIN  
METALS

HIGH RESISTANCE TO  
UV RAYS

SUITABLE FOR  
FIBERGLASS AND  
METAL SURFACES

NANOTECH  
PRODUCT

Antifouling has always been a common concern among boat owners. Durability, efficiency and costs are the factors that most affect the choice of the product.

CRYSTAL BOAT is a 2K gliding paint with an antifouling effect suitable for fibreglass and metal surfaces.

### **Environmentally Friendly**

CRYSTAL BOAT promises to protect the environment because, as being completely devoid of biocides, its environmental impact is practically close to zero.

### **CRYSTAL BOAT is a long-lasting self-cleaning paint.**

Given its high resistance to exfoliation, the hull is expected not to be repainted earlier than three 3 years. It's therefore for a mechanical reason that Crystal Boat can be used in the same way as a conventional antifouling paint.

Thanks to these characteristics, the surface layer of the paint prevents fouling from coming into contact with the hull and, at the same time, thanks to the friction generated by the speed of the boat on the water, facilitates the removal of barnacles and algae that, in the event of prolonged stops, would inevitably end up attacking the hull.

Moreover, this paint offers two very interesting benefits:

#### **1) Anti-osmosis barrier:**

CRYSTAL BOAT creates an almost total protection against moisture in the same way as anti-osmosis treatments;

#### **2) Anti-galvanic insulation:**

The paint creates an insulating layer that protects the boat against galvanic currents. CRYSTAL BOAT is also certified to handle impacts of up to 45 Newton and resist all types of solvents.

Finally, unlike many conventional antifouling paints, CRYSTAL BOAT doesn't ruin itself after a prolonged contact with air or water.

The boats treated with this paint can therefore be hauled and launched an unlimited number of times.
